

Progress for Swap Monsters - Daily Journal

Day 1:

Put together the sprite w/ animations, jump SFX, and added walking sound effects that randomize on each step. Started changing the code that played the animation because it was really restrictive and I want to add attack animations and such.

Day 2:

Removed the original player script and coded my own with a state machine. Left and Right controls are A and D and Jump is Space. You can punch with E while on the ground. Dash while in the air by holding a direction and pressing W. While in the air you can also double jump by pressing space. You can cling to walls while in the air which also gives you another double jump and dash.

Day 3:

Added a swap mechanic that allows you to switch between three different characters. Swap buttons are Q, W, and E. Movement is still A and D. Air Dash is now shift. When you switch your character it also resets your double jump and air dash.

Day 4:

Added abilities for each character that can be used with shift. The bunny's ability is an air dash. The Blue guy's ability is a bow. The owlet's ability is a glide. Left and right and A and D. Jump is space. Switch between characters with Q, W and E. Also zoomed out the camera to compliment how fast the character can move so you can see where you are going easier. Next I'll start working on the level and things for the blue guy to shoot.

Day 5:

Added a meter that controls how many switches you have left. Also added breakables for the blue guy to shoot. The green ones will refill your meter by 1 when broken and the red ones will get in your way. The meter also recharges when on the ground. Also added inputs to switch your character with the arrow keys for easier use.

Day 6:

Started drawing out and planning the map/Break Day

Day 7:

Put together the map I planned out yesterday and added some finishing touches to end the project.
